

Pro Traxion P51 / Mini Traxion P07

Certain situations can prevent the rope from jamming
Attention, warning !

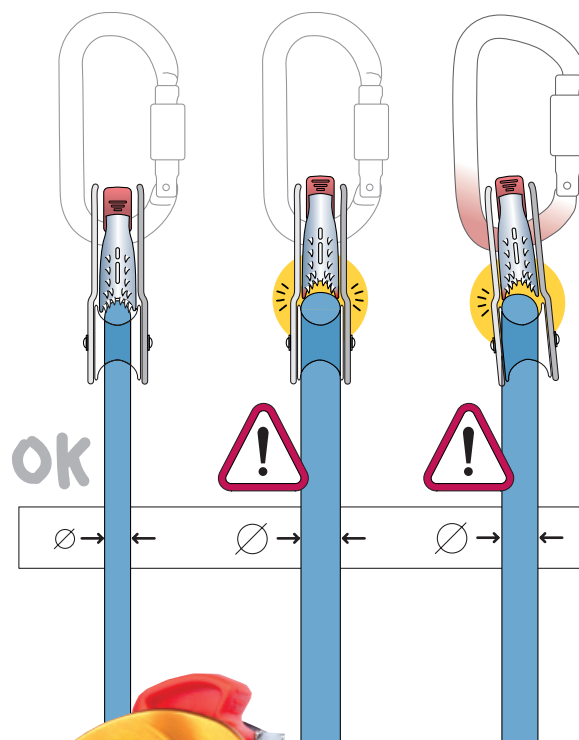

In certain situations,
in particular when the free end
of the rope is under tension
(fig. A: counter-balance haul;
fig. B: simple pulley system)
and depending on:

- the characteristics of the rope
(stiff and/or very static and/or
large diameter and/or condition
of the sheath)
- and/or the position of the pulley
(set askew by the carabiner, or by
pressure against an object...),

**the rope may not jam in
the device.**

It is absolutely necessary to test
the compatibility of the self-
jamming pulley with the other
components of your system in a
«safe» environment before using
the system at height. Take steps
to back-up the system.
